Feb. 2026

Introduction

Our code is dependant to the numpy library

1st Robot stops the opponent from scoring goals

2nd and 3rd Robots are mainly programmed to score goals

Robots Communication

2nd and 3rd Robots send ball info (if there is one) to the 1st Robot

1st Robot computes the ball position and sends it back

Ball Positioning Algorithm

If there are at least 2 ball info, a system of equations is solved

If there is only 1 ball info its position is estimated

If there is no ball info its position is predicted

Thank you!
