Introduction

The numpy library is required for our code to run

One of our robots is the Goalkeeper

The other two robots of ours are mainly Attackers

Team Communication

Attackers send ball and position data to the Goalkeeper

The Goalkeeper then computes the ball position and send it to Attackers

Ball Computation Algorithm

A system of equations is solved, if there are at least 2 data available

An estimation is conducted, if there is only 1 data available

A prediction is in place, if there is no ball data available

Thank you!
